## **Introduction**

The Forest and Rangeland Renewable Resource Planning Act (RPA) of 1974 required each Forest Service Region to assess its wildlife and fish populations in terms of supply, demand and their ecosystem association(s).

A species list for each state in the Northern Region (Idaho, Montana and North Dakota) was compiled to meet one portion of the RPA species-habitat association requirement. The first part of the list consists of all wildlife and fish found on Forest Service land in each state in the Northern Region. The second presents wildlife and fish species found within each state regardless of land ownership.

The status of each species (common, uncommon, rare and endangered or threatened, and special interest) is reported. A status of common was based upon a species occurrence throughout a large portion of a state or the region in relatively moderate to high numbers. A status of uncommon was reported when a species range was limited regardless of its local density or occurrence in relatively low numbers throughout a large area.

The status of rare and endangered, threatened, or special interest are state classifications and were taken as such from any current state list available. Montana's state list for rare and endangered or threatened is the same as the U.S. Fish and Wildlife Service, whereas, Idaho and North Dakota have their own separate lists. The literature used in compiling this list is presented by animal groups.

Scientific names were taken from Peterson's Field Guides and the American Fisheries Society list of Common and Scientific Names of Fishes. Other names were decided upon by their frequency of occurrence in all other literature reviewed. Subspecies were used when they occurred on either rare and endangered, threatened, or special interest lists.
